Notes: Collector light current I_L, Collector-emitter saturation voltage V_{CE(SAT)}, Relative current , Response time is measured within 2~5mm between photointerrupter's top and reflecting surface. Its value is affected by the smooth of light reflecting surface.

Fig.1 Forward current vs. forward voltage

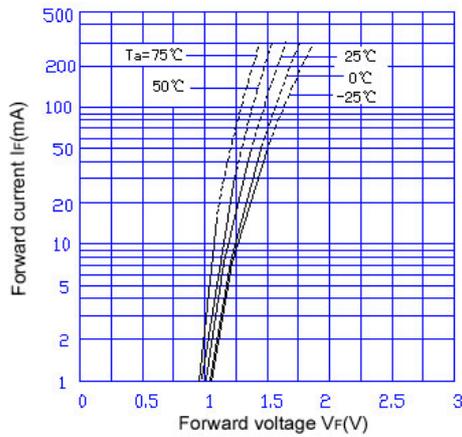

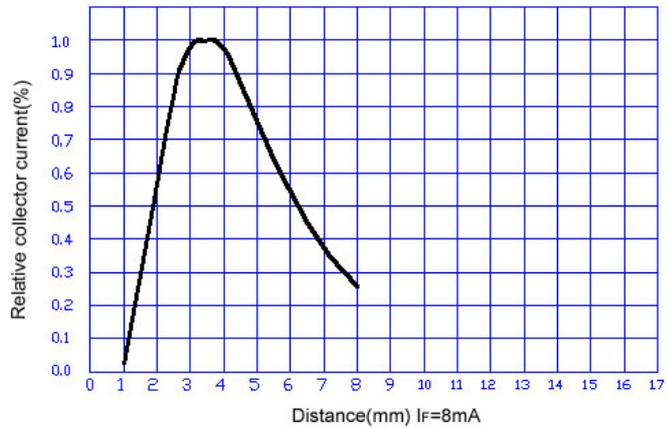

Fig.2 Relative collector current vs. distance

- Distance in Fig.2 is from photointerrupter's top to the reflecting surface.
- The reflecting surface is a sub-reflection aluminium plate. its surface is parallel to the top of photointerrupter.
- When relative collector current rises to 1.0, the conversion efficiency is the highest under this distance.
- The curves above are for you reference.
